

The Recharge conditioning program is; once a battery has reached one to two years of age turn on the lights or partially drain some power from the battery, treat with the recommended amount of Recharge and charge the battery on a trickle charger.

For best results; agitate as outlined in hand hint 1/ below before charging.

This will dissolve any sulphation build-up that has occurred in the early part of the battery's life and help reduce any further build-up. Treatment should be repeated every 2-3 years, intermittent charging of the battery every six months or so is also advisable to ensure the battery stays in top condition.

*Good quality and deep cycle **batteries should go 8 to 10 years** provided you start early enough, some will go a lot more.*

Note: Most batteries start sulphating in the shop before you buy them!

So: If you are struggling to get past one or two years treat from day one just be aware that some battery companies may say treatment voids the warranty, a *good excuse*, this is why we officially recommend waiting until the warranty expires.

Please note it is very important to **READ & FOLLOW THE INSTRUCTIONS**

Note: Charging the battery means put on a mains powered or solar powered charger not just run the vehicle, alternators are too hard and too fast which is why we recommend charging on an independent charger 2 to 3 times a year between treatments.

Handy hints:

1/ Once the battery has been dosed with the required amount use the applicator or a hydrometer to mechanically stir the Recharge into the electrolyte by sucking up and blowing the electrolyte back into each cell several times. It is **very important** to mix Recharge into the electrolyte electronically by **charging the battery on a mains powered charger**.

2/ With tired or dead batteries once the battery has been treated and has been on the charge for a few hours give the battery a good shake up and/or drop it lightly onto a clean hard surface to dislodge any hard to dissolve deposits.

3/ Discharging and recharging the battery a second time often helps.

Please note it is very important to **READ & FOLLOW THE INSTRUCTIONS**
